LUNA SDK Examples

Welcome to Example guide, which describes sample code for VisionLabs LUNA SDK. The presented examples are compatible with SDK version 4.0.0 and newer.

Please note that while these examples are released under MIT license, the SDK itself is not. Contact us via email (info@visionlabs.ru) for evaluation and/or licensing terms and conditions.

Aside from examples itself, there are some supplementary materials you may find useful. Look into *cmake/* folder for a CMake find script for the SDK. CMake usage is not mandatory but we advise you to do it.

Currently we support 64 bit Windows and Linux. On Windows, everything should work with Visual Studio 2015. On Linux, we tested this code with GCC 4.8.5. The other versions may work as well. Note, that the SDK is officially supported on RedHat Linux families (RHEL, CentOS, Fedora).

Building Examples

The build sequence for basic examples (example_extraction, example_estimation, example_descriptor_io, example_index) is presented below. The main dependency for basic examples is LUNA SDK, these examples should work out of the box. From Luna SDK root.

```
$ mkdir build && cd build
$ cmake -DCMAKE_BUILD_TYPE=Release -DFSDK_ROOT=.. ../examples
$ make
```

Optionally you can enable complementary examples, which require additionally installed 3rd party libraries:

- Qt example (example_qt) - shows interface compatibility of LUNA SDK (FaceEngine) and Qt library with version 5+. See section “QT example requirements”.
- Liveness examples (example_liveness, example_depth) - shows interface compatibility of LUNA SDK (LivenessEngine) and OpenCV library. See sections “Liveness example requirements” and “Depth example requirements”.

Running Examples

Note: Data folder is required at <LUNA_SDK_root>/data on Windows and on Linux.

```
# Detecting, Extracting, Matching
$ build/example_extraction/example_extraction examples/images/Cameron_Diaz.
ppm examples/images/Cameron_Diaz_2.ppm 0.7
```

```
$ build/example_extraction/example_extraction examples/images/Cameron_Diaz.
ppm examples/images/Jennifer_Aniston.ppm 0.7

# Detecting, Landmarks, Estimating (Attributes, Quality, Eyes, Head pose)
$ build/example_estimation/example_estimation examples/images/portrait.ppm

# Indexing
$ build/example_index_hnsw/example_index_hnsw examples/images/Cameron_Diaz.
ppm examples/images/ examples/images_lists/list.txt 0.7

# Descriptor and batch saving/loading
$ build/example_descriptor_io/example_descriptor_io examples/images/portrait
.ppm
```

Building Examples for Windows

Building command (from "FSDK_ROOT"):

```
$ mkdir build install && cd build
$ cmake -G "Visual Studio 15 2017 Win64" -DCMAKE_BUILD_TYPE=Release -
DFSDK_ROOT=.. -DCMAKE_INSTALL_PREFIX=..\install ../examples
$ cmake --build . --config Release --target install
```

Note: After this steps You can find examples is in '[FSDK_ROOT\install\bin\](#)' directory.

Running on Windows

Note: Manually register the *necessary dynamic libraries* (.dll) in the system (if needed).Or copy all necessary dynamic libraries (*.dll) in the directory with an example.

Run the command from "FSDK_ROOT".

```
$ install\bin\example_estimation.exe examples/images/Jennifer_Aniston.jpg
```

LivenessEngineSDK.dll, *FaceEngineSDK.dll*, *tbb.dll*, *flower.dll*, **TrackEngineSDK.dll*

Qt Example

QT examples requirements

To build this example Qt of version 5+ library and cmake `DWITH_QT_EXAMPLE` option is required to be installed.

Build with Qt example

Run the command from “from FSDK_ROOT/build”.

```
$ cmake -DFSDK_ROOT=.. -DWITH_QT_EXAMPLE=ON ../examples
$ make
```

If Qt is installed in non-system directory and can't be found by cmake automatically, you also need to specify path to Qt.

Example:

```
$ cmake -DFSDK_ROOT=.. -DWITH_QT_EXAMPLE=ON -DQt5Core_DIR=/usr/lib64/cmake/
Qt5Core -DQt5Gui_DIR=/usr/lib64/cmake/Qt5Gui -DQt5_DIR=/usr/lib64/cmake/
Qt5 ../examples
```

Note for Windows: when you build and install Qt example, qt dynamic libraries (QtCore.dll, QtGui.dll) are installed.

Run Qt example

```
$ build/example_qt/example_qt examples/images/Jennifer_Aniston.jpg
```

Building Qt example on Windows

Building command (from FSDK_ROOT/):

```
$ mkdir build install && cd build
$ cmake -G "Visual Studio 15 2017 Win64" -DFSDK_ROOT=.. -
DCMAKE_INSTALL_PREFIX=..\install -DCMAKE_BUILD_TYPE=Release -
DWITH_FREEIMAGE_EXAMPLE=ON -DWITH_QT_EXAMPLE=ON -DQT5_CMAKES=<
absolute_path_to_Qt>\5.7\msvc2015_64\lib\cmake\ -DQt5Core_DIR=<
absolute_path_to_Qt>\5.7\msvc2015_64\lib\cmake\Qt5Core -DQt5Gui_DIR=<
absolute_path_to_Qt>\5.7\msvc2015_64\lib\cmake\Qt5Gui -DQt5_DIR=<
absolute_path_to_Qt>\5.7\msvc2015_64\lib\cmake\Qt5 ../examples
$ cmake --build . --config Release --target install
```

Running on Windows (from FSDK_ROOT/):

Note: Manually register the *necessary dynamic libraries* (.dll) in the system (if needed). Or copy all necessary dynamic libraries (*.dll) in the directory with an example.

```
$ install\bin\example_estimation.exe examples/images/Jennifer_Aniston.jpg
```

LivenessEngineSDK.dll, *FaceEngineSDK.dll*, *tbb.dll*, *flower.dll*, **TrackEngineSDK.dll*

Depth example

Depth example performs liveness check based on depth frames captured from Intel Realsense Depth cameras.

Depth example requirements

Software requirements:

The following 3rd-party dependencies are required in order to build and run depth example:

- OpenCV
 - core
 - imgproc
 - highgui
- Intel Realsense SDK

Hardware requirements:

- Intel RealSense depth cameras either D400 series or the SR300 and compatible device drivers.

To verify that all realsense dependent libraries are installed correctly in the system, we recommend building librealsense SDK from source.

For build instructions please visit the following links:

- Linux: <https://github.com/IntelRealSense/librealsense/blob/master/doc/installation.md>
- Windows: https://github.com/IntelRealSense/librealsense/blob/master/doc/installation_windows.md

For more information about RealSense SDK see <https://github.com/IntelRealSense/librealsense>.

Note: In order to run depth example on Windows make sure you have copied all example's dependent dlls into directory where example_depth binary is located, or just put them into OS system's default path.

Build depth example command

Run the command from "FSDK_ROOT/examples".

```
$cmake -Bbuild -H. -DCMAKE_INSTALL_PREFIX=./  
-DOpenCV_DIR=<absolute_path_to_opencv_install_directory>
```

```
-Drealsense2_DIR=<absolute_path_to_realsense_sdk_install_directory>/lib/  
  cmake/realsense2  
-DFSDK_ROOT=<absolute_path_to_luna_sdk_root_directory>  
-DWITH_DEPTH_EXAMPLE=ON  
$ cmake --build Build --config Release --target install
```

Run depth example

Run the command from “FSDK_ROOT/examples”.

```
$ bin/example_depth <absolute_path_to_luna_sdk_data_directory>
```

Liveness Examples

For these examples DLSDK_ROOT path should be specified. By default, LivenessEngine libraries are located near the FaceEngine libraries and DLSDK_ROOT same as DFSDK_ROOT.

Simple Liveness (example_liveness)

Liveness example requirements

To build this example OpenCV library (modules listed below) and cmake DWITH_LIVENESS_EXAMPLE option are required to be installed. By default, DWITH_LIVENESS_EXAMPLE option is disabled.

OpenCV should contain the next modules:

- core
- imgproc
- highgui
- videoio

Building Liveness example command

Run the command from “FSDK_ROOT/build”.

```
$ cmake ../examples -DCMAKE_BUILD_TYPE=Release -DWITH_LIVENESS_EXAMPLE=ON -  
  DOpenCV_DIR=<path_to_opencv> -DFSDK_ROOT=.. -DLSDK_ROOT=..  
$ make
```

Run Simple liveness example

```
$ build/example_liveness/example_liveness <web_cam_id> <test_number>
```

Best shot example with TrackEngine

What it does

This example demonstrates how to use the TrackEngine to track human face detection and to check him with eye estimation status. This example shows how to pick frame with the best quality face out of video sequence. You can find binary of this example in `FSDK_ROOT/examples/bin/possible_output_prefix`. BestShot example can display the following results:

- accepted - user blinked
- denied - user did not blink

Prerequisites

This example assumes that you have read the **FaceEngine Handbook** and **TrackEngine Handbook** already (or at least have it somewhere nearby for reference) and are familiar with some core concepts, like memory management, object ownership and life-time control. This sample will not explain these aspects in detail.

Requirements

OpenCV library installation containing next modules:

- highgui
- imgproc
- videoio

Example walkthrough

To get familiar with FSDK and TSDK usage and common practices, please go through `example_estimation` first.

How to run

This example can be run without parameters in this case a video camera with index 0 will be used,

```
./example_bestshot_trackengine
```

or you can pass the number of video cameras:

```
./example_bestshot_trackengine 2
```

Building for Linux

Building command (from FSDK_ROOT/examples/build):

```
$ cmake -DFSDK_ROOT=<absolute_path_to_fsdk_root_dir> -DTSDK_ROOT=<
  absolute_path_to_fsdk_root_dir> -DWITH_BESTSHOT_EXAMPLE=ON -DOpenCV_DIR=<
  abs_path_to_opencv> -DCMAKE_BUILD_TYPE=Release -DCMAKE_INSTALL_PREFIX=<
  absolute_path_to_fsdk_root_dir>/examples -DCMAKE_MODULE_PATH=<
  absolute_path_to_fsdk_root_dir>/examples/cmake ../
  example_bestshot_trackengine
$ cmake --build . --config Release --target install
```

Building for Windows

Building command (from FSDK_ROOT/examples/build):

```
$ cmake -G "Visual Studio 14 2015 Win64" -DFSDK_ROOT=<
  absolute_path_to_fsdk_root_dir> -DTSDK_ROOT=<
  absolute_path_to_fsdk_root_dir> -DWITH_BESTSHOT_EXAMPLE=ON -DOpenCV_DIR=<
  abs_path_to_opencv> -DCMAKE_BUILD_TYPE=Release -DCMAKE_INSTALL_PREFIX=<
  absolute_path_to_fsdk_root_dir>/examples -DCMAKE_MODULE_PATH=<
  absolute_path_to_fsdk_root_dir>/examples/cmake ../
  example_bestshot_trackengine
$ cmake --build . --config Release --target install
```

Running on Linux

There is prebuilt demo, see FSDK_ROOT/examples/bin/*possible_output_prefix*/ . To run it change your working directory to FSDK_ROOT and type:

```
$ ./examples/bin/*possible_output_prefix*/./example_bestshot_trackengine
```

Running on Windows

For Windows you will have to run bat script that is in the same directory as ./example_bestshot_trackengine.exe. It's win32_copy_script.bat for win32 and win64_copy_script.bat for win64. So for Windows, to run demo you will have to type:

```
$ .\examples\bin\*possible_output_prefix*\win32_copy_script.bat
$ .\examples\bin\*possible_output_prefix*\example_bestshot_trackengine.exe
```

or:

```
$ .\examples\bin\*possible_output_prefix*\win64_copy_script.bat  
$ .\examples\bin\*possible_output_prefix*\example_bestshot_trackengine.exe
```

Depth liveness example

What it does

This example demonstrates depth liveness estimation using Intel RealSense cameras. It predicts whether a person in an image is real or fake. This example captures frames from colored(rgb8) and depth(r16) sensors, detects a face in the input image, and performs liveness estimation.

Expected output

If liveness depth estimation predicted that a person in the image is alive, the bounding box is colored green. It is colored red otherwise.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

Example walkthrough

Example source code contains comments to help you understand what is going on.

How to run

Use the following command to run the example.

```
./example_depth <absolute_path_to_luna_sdk_data_directory>
```

Descriptor IO example

What it does

The example demonstrates how to save a descriptor and descriptor batch to a file.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

Example walkthrough

To get familiar with FSDK usage and common practices, please go through `example_extraction` first.

How to run

Use the following command to run the example.

```
./example_descriptor_io <some_image.ppm>
```

Example output

Warped images, descriptors, descriptor batch.

Detection example

What it does

This example demonstrates how to use the detector to get a face bbox (bounding box) and landmarks.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

Example walkthrough

To get familiar with FSDK usage and common practices, please go through `example_extraction` first.

How to run

Use the following command to run the example.

```
./example_detection <some_image.ppm>
```

Example output

```
simpleDetect. bbox only result:

Estimation example

What it does

This example demonstrates how to use the detector and to estimate a mouth state, emotions, face attributes, quality, eye and head pose on an image.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

Example walkthrough

To get familiar with FSDK usage and common practices, please go through `example_extraction` first.

How to run

```
./example_estimation <some_image.ppm>
```

Example output

Warped images with faces.

```
Detection 1
Rect: x=277 y=426 w=73 h=94
Attribute estimate:
gender: 0.999705 (1 - man, 0 - woman)
wearGlasses: 0.000118364 (1 - person wears glasses, 0 - person doesn't wear
    glasses)
age: 17.7197 (in years)
Quality estimate:
light: 0.962603
dark: 0.974558
gray: 0.980648
blur: 0.955808
quality: 0.955808
Eye estimate:
left eye state: 2 (0 - close, 1 - open, 2 - noteye)
right eye state: 2 (0 - close, 1 - open, 2 - noteye)
```

```
Detection 2
Rect: x=203 y=159 w=63 h=89
Attribure estimate:
gender: 0.0053403 (1 - man, 0 - woman)
wearGlasses: 0.000911222 (1 - person wears glasses, 0 - person doesn't wear
glasses)
age: 16.1504 (in years)
Quality estimate:
light: 0.964406
dark: 0.971644
gray: 0.981737
blur: 0.955808
quality: 0.955808
Eye estimate:
left eye state: 0 (0 - close, 1 - open, 2 - noteye)
right eye state: 2 (0 - close, 1 - open, 2 - noteye)
```

Extraction example

What it does

This example demonstrates how to detect a face on an image, how to extract biometric data of that face (so called descriptor) and how to compare two descriptors. As the result of its work, the example program will tell you whether people shown on two images are actually the same person or not. It will also allow you to pick a threshold for such classification.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

The FaceEngine SDK is not about image/video loading, format decoding and such things. It's about facial recognition. So this example will not cover topics like how to load an image. There are no such functions built into the SDK either. For demonstration purposes we've included some freeware PPM reader code into the sample. We picked PPM image format because it is simple. You can read about it here: https://en.wikipedia.org/wiki/Netpbm_format. To prepare data for tests you may use such tools as ImageMagick, Gimp, XnView.

Example walkthrough

We present a rather rich face processing pipeline. In fact, it is a bit too rich for this sample, but it was made so intentionally to give you a clue of some real world usage scenarios.

Preparations

SDK initialization. It is pretty straightforward and self-explanatory, so we will not discuss it here.

Face detection

This stage is implemented in `extractDescriptor` function. At this stage we have an image. Presumably, there is a face somewhere in it and we would like to find it. For that purpose, a face detector is used. We use it like so:

```
// Create default detector, see faceengine.conf - "defaultDetectorType"
faceDetector = fsdk::acquire(faceEngine->createDetector());
if (!faceDetector) {
    ...
}
...
// Detect no more than 10 faces in the image.
enum { MaxDetections = 10 };

// Data used for detection.
fsdk::Detection detections[MaxDetections];
int detectionsCount(MaxDetections);
fsdk::IDetector::Landmarks5 landmarks5[MaxDetections];

// Detect faces in the image.
fsdk::ResultValue<fsdk::FSDKError, int> detectorResult = faceDetector->
    detect(
        image,
        image.getRect(),
        &detections[0],
        &landmarks[0],
        detectionsCount
    );
if (detectorResult.isError()) {
    ...
}
detectionsCount = detectorResult.getValue();
```

As the result we know whether we could detect faces (and how many of them) and what prevented us from achieving that.

Descriptor extraction

This stage is implemented in `extractDescriptor` function. When we have a reliable face detection, we need to extract some data from it that can be used for comparison or *matching*. Such data is contained in descriptor object. A descriptor may be extracted from an image using face detection and landmarks coordinates. Later, one or multiple descriptors can be matched to determine face similarity.

```
// Create face descriptor.
fsdk::IDescriptorPtr descriptor = fsdk::acquire(faceEngine->createDescriptor
    ());
if (!descriptor) {
    ...
}

// Extract face descriptor.
// This is typically the most time-consuming task.
fsdk::ResultValue<fsdk::FSDKError, float> descriptorExtractorResult =
    descriptorExtractor->extract(
        image,
        detections[bestDetectionIndex],
        landmarks5[bestDetectionIndex],
        descriptor
    );
if(descriptorExtractorResult.isError()) {
    ...
}
```

Descriptor matching

This stage is pretty simple. We match two descriptors and see how similar they are. For that we use a descriptor matcher object.

```
// Descriptors similarity.
float similarity;

// Match 2 descriptors.
// Returns similarity in range (0..1],
// where: 0 means totally different.
//       1 means totally the same.
```

```
fsdk::ResultValue<fsdk::FSDKError, fsdk::MatchingResult>
    descriptorMatcherResult =
        descriptorMatcher->match(descriptor1, descriptor2);
if (descriptorMatcherResult.isError()) {
    ...
}

similarity = descriptorMatcherResult.getValue().similarity;
```

Similarity score tells how similar these descriptors are. Its value is in (0..1] range. Values near 1 tell us that the descriptors are very similar.

Putting it all together

The main function just calls all the above in right order. Aside from that it parses command line and loads images. After all stages finish it writes the result.

Human Detection example

What it does

This example demonstrates how to use the human detector to get a human bbox (bounding box).

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

Example walkthrough

To get familiar with FSDK usage and common practices, please go through `example_extraction` first.

How to run

Use the following command to run the example.

```
./example_human_detection <some_image.ppm>
```

Example output

```
detectHumanExample. Detect results for 0 image:
  detected: 1 humans
  next human:
    Rect:
      x = 121
      y = 2
      w = 462
      h = 543
      score = 0.997865
detectHumanExample. Detect results for 1 image:
  detected: 1 humans
  next human:
    Rect:
      x = 121
      y = 2
      w = 462
      h = 543
      score = 0.997865
detectHumanExample. Redetect results for image[0]:
  next human:
    Rect:
      x = 85
      y = 19
      w = 502
      h = 490
      score = 0.997068
detectHumanExample. Redetect results for image[1]:
  next human:
    Rect:
      x = 85
      y = 19
      w = 502
      h = 490
      score = 0.997068
```

Reidentification example

What it does

This example demonstrates how to:

- detect a human body in an image,

- extract data of that body (so called human descriptor),
- compare descriptors received from different images.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

Example walkthrough

We present a rather rich human processing pipeline. In fact, it is a bit too rich for this sample, but it was made so intentionally to give you a clue of some real world usage scenarios.

Preparations

SDK initialization. It is pretty straightforward and self-explanatory, so we will not discuss it here.

Human detection

At this stage we have an image. Presumably, there is a human somewhere in it and we would like to find it. For that purpose, a human detector is used. We use it like so:

```
fsdk::IHumanDetectorPtr humanDetector = fsdk::acquire(faceEngine->
    createHumanDetector());
if (!humanDetector) {
    ...
}
...
// Detect no more than 10 humans in the image.
const int maxDetectionCount = 10;

// Detect humans in images.
fsdk::ResultValue<fsdk::FSDKError, fsdk::Ref<fsdk::IResultBatch<fsdk::Human
>>> detectorResult = humanDetector->detect(
    fsdk::Span<const fsdk::Image>(images.data(), images.size()),
    fsdk::Span<const fsdk::Rect>(rects.data(), rects.size()),
    maxDetectionCount);
```

Extraction

When we have a human detection, we need to extract data from it. The data is contained in descriptor object can be used for comparison or *matching*. A descriptor may be extracted from an image using human detection. Later, one or multiple descriptors can be matched to determine human similarity.

```
// Create human descriptor.
fsdk::IDescriptorPtr descriptor = fsdk::acquire(faceEngine->createDescriptor
    (fsdk::DV_MIN_HUMAN_DESCRIPTOR_VERSION));
if (!descriptor) {
    ...
}

// Create descriptor extractor. For human descriptor extractor pass the
// version DV_MIN_HUMAN_DESCRIPTOR_VERSION or 101
fsdk::IDescriptorExtractorPtr descriptorExtractor = fsdk::acquire(engine->
    createExtractor(fsdk::DV_MIN_HUMAN_DESCRIPTOR_VERSION));

// Extract human descriptor.
fsdk::ResultValue<fsdk::FSDKError, float> descriptorExtractorResult =
    descriptorExtractor->extractFromWarpedImage(
        humanWarpedImage,
        descriptor
    );
if(descriptorExtractorResult.isError()) {
    ...
}
```

Descriptor matching

For example, we take only first descriptor in the first image and all detections in other images for matching. For that we use a descriptor matcher object.

```
// Create descriptor matcher.
fsdk::IDescriptorMatcherPtr descriptorMatcher = fsdk::acquire(engine->
    createMatcher(fsdk::DV_MIN_HUMAN_DESCRIPTOR_VERSION));

// Match descriptors.
// Returns similarity in range (0..1],
// where: 0 means totally different.
//       1 means totally the same.
fsdk::ResultValue<fsdk::FSDKError, fsdk::MatchingResult>
    descriptorMatcherResult =
```

```

        descriptorMatcher->match(descriptors[0][0], descriptors[i][j]);
    if (descriptorMatcherResult.isError()) {
        ...
    }

    float similarity = descriptorMatcherResult.getValue().similarity;

```

Similarity score tells how similar these descriptors are. Its value is in (0..1] range. Values near 1 tell us that the descriptors are very similar.

How to run

Use the following command to run the example.

```
./example_human_extraction <some_image1> <some_image2>
```

Example output

```

Similarity of current descriptor and all human descriptors in other images
in descent order:
0.920459 :: image number is 1, detection number is 6
0.63473  :: image number is 1, detection number is 1
0.572745 :: image number is 1, detection number is 5
0.562269 :: image number is 1, detection number is 2
0.55178  :: image number is 1, detection number is 7
0.539377 :: image number is 1, detection number is 3
0.528099 :: image number is 1, detection number is 4
0.511602 :: image number is 1, detection number is 8
0.307247 :: image number is 1, detection number is 9

```

Index example

What it does

This example demonstrates how to create HNSW index from the batch of descriptors and use it to search for descriptor's closest matches efficiently.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object

ownership, and life-time control. This sample will not explain these aspects in detail.

It is advisable to read HNSW Index chapter before going through this example.

Note: hnsw index creation is not supported on embedded and 32-bit desktop platforms.

Example walkthrough

To get familiar with FSDK usage and common practices, please go through `example_extraction` first.

How to run

Use the following command to run the example.

```
./example_index_hnsw <image.ppm> <imagesDir> <list> <threshold>
```

Example output

```
Images: "images/Cameron_Diaz.ppm" and "Cameron_Diaz.ppm" belong to one
person.
Images: "images/Cameron_Diaz.ppm" and "Cameron_Diaz_2.ppm" belong to one
person.
Images: "images/Cameron_Diaz.ppm" and "Jason_Statham.ppm" belong to
different persons.
Images: "images/Cameron_Diaz.ppm" and "Jason_Statham_2.ppm" belong to
different persons.
Images: "images/Cameron_Diaz.ppm" and "Jennifer_Aniston.ppm" belong to
different persons.
Images: "images/Cameron_Diaz.ppm" and "Jennifer_Aniston_2.ppm" belong to
different persons.
```

Infra Red Liveness Estimation example

What it does

This example demonstrates how to use the detector and to estimate a liveness on an infra red image.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

How to run

Use the following command to run the example.

```
./example_ir <some_infra_red_image>
```

Example output

Warped images with faces.

```
[LivenessIREstimatorExample] Detecting faces.  
Found 6 face(s).  
Detection 1  
Rect: x=29.1432 y=25.6546 w=72.6785 h=80.0122  
Face is real: true score: 0.999407  
Detection 2  
Rect: x=29.8662 y=233.287 w=72.7124 h=80.0827  
Face is real: true score: 1  
Detection 3

Face is real: true score: 0.999971
```

Liveness example

What it does

This example demonstrates how to capture videostream from web camera, using OpenCV, create LivenessEngine core object and Liveness tests, pass frames to ILiveness instances in order to retrieve result of the test.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** and **LivenessEngine Handbook** (or at least have them somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

This example requires installed OpenCV library with imgproc, highgui and videoio modules, for additional information refer to <https://opencv.org/>.

Example walkthrough

This example consists of the following stages:

Stage 0. Preparations

Argument parsing, SDK initialization, testing sequence preparation, video capturing.

Stage 1. Main cycle

This stage is implemented in `while(process)` cycle. At this stage we grab frame from video capture, convert it from BGR to RGB, wrap it into FaceEngine structures, pass Image to liveness instance and output picture and action calls to user via Video window and console.

```
while(process){
    //Grab frame
    cap >> output;
    if(!output.empty()){
        cv::Mat rgb;
        cv::cvtColor(output,rgb,CV_BGR2RGB);
        //Wrap frame into fsdk container
        Image img(rgb.cols, rgb.rows, fsdk::Format::R8G8B8, rgb.data);
        ResultValue<LSDKError,bool> result = liveness->update(img);
        if((result.getResult()==lsdk::ERR_NOT_READY)&&start){
            start = false;
            //Ask for an action
            std::clog << advices[i] << std::endl;
        }
        if(result.isOk()){
            //Save result
            success = success & result.getValue();
            process = false;
        }
    }
}
```

```

        //Output video
        cv::Mat mirror;
        cv::flip(output, mirror, 1);
        cv::namedWindow("Video", CV_WINDOW_AUTOSIZE);
        cv::imshow("Video", mirror);
        cv::waitKey(1);
    } else process = false;
}

```

As the result we get flag whether or not liveness detection was successful. This cycle repeats N times (N is specified as program argument). Program result equals to Bitwise AND of every cycle iteration result. if result == true then liveness is successful, otherwise not.

How to run

Use the following command to run the example.

```
./example_liveness <camera_number> <test_number>
```

Qt example

What it does

This example demonstrates how to use the qt library to processing images of different formats by example the detector, landmarks5, landmarks68 and to estimate a smile, emotions, face attributes, quality, eye, head pose and gaze in an image.

Prerequisites

This example assumes that you have already read the **FaceEngine Handbook** (or at least have it somewhere nearby for reference) and know some core concepts, like memory management, object ownership, and life-time control. This sample will not explain these aspects in detail.

More detailed information about the qt library can be obtained by clicking on the link <https://www.qt.io/>.

Example walkthrough

To get familiar with FSDK usage and common practices, please go through example_extraction first.

How to run

Use the following command to run the example.

```
./example_qt <some_image>
```

Example output

Warped images with faces, image with face detection and marked detection points.

```
Detection 1
Rect: x=277 y=426 w=73 h=94
Attribure estimate:
gender: 0.999705 (1 - man, 0 - woman)
wearGlasses: 0.000118364 (1 - person wears glasses, 0 - person doesn't wear
glasses)
age: 17.7197 (in years)
Quality estimate:
light: 0.962603
dark: 0.974558
gray: 0.980648
blur: 0.955808
quality: 0.955808
Eye estimate:
left eye state: 2 (0 - close, 1 - open, 2 - noteye)
right eye state: 2 (0 - close, 1 - open, 2 - noteye)

Detection 2
Rect: x=203 y=159 w=63 h=89
Attribure estimate:
gender: 0.0053403 (1 - man, 0 - woman)
wearGlasses: 0.000911222 (1 - person wears glasses, 0 - person doesn't wear
glasses)
age: 16.1504 (in years)
Quality estimate:
light: 0.964406
dark: 0.971644
gray: 0.981737
blur: 0.955808
quality: 0.955808
Eye estimate:
left eye state: 0 (0 - close, 1 - open, 2 - noteye)
right eye state: 2 (0 - close, 1 - open, 2 - noteye)
```

Best shot example

This example shows how to pick frame with the best quality face out of video sequence. This example is shipped as prebuilt library too, you can find its binary and headers in `FSDK_ROOT/examples/possible_output_prefix/lib` and `FSDK_ROOT/examples/include`, dll files are in `FSDK_ROOT/examples/possible_output_prefix/bin` folder. BestShot example can display the following results:

- accepted - user blinked
- denied - user did not blink
- fraud - primary detection has changed, someone else is in the frame.

Please note, it is possible to have “accepted” or “denied” result display simultaneously with “fraud” if there is someone else in front of the camera besides the user.

Requirements

OpenCV library installation containing next modules:

- core
- imgproc
- imgcodecs

Building for linux

Building command (from `FSDK_ROOT/examples/build`):

```
$ cmake -DFSDK_ROOT=<absolute_path_to_fsdk_root_dir> -DOpenCV_DIR=<abs_path_to_opencv> -DPM_WITH_DEMO=ON -DCMAKE_BUILD_TYPE=Release -DCMAKE_INSTALL_PREFIX=<absolute_path_to_fsdk_root_dir>/examples -DCMAKE_MODULE_PATH=<absolute_path_to_fsdk_root_dir>/examples/cmake ../example_bestshot
$ make install
```

Building for windows x64

Building command (from `FSDK_ROOT/examples/build`):

```
$ cmake -G "Visual Studio 15 2017 Win64" -DFSDK_ROOT=<absolute_path_to_fsdk_root_dir> -DOpenCV_DIR=<abs_path_to_opencv> -DPM_WITH_DEMO=ON -DCMAKE_BUILD_TYPE=Release -DCMAKE_INSTALL_PREFIX=<absolute_path_to_fsdk_root_dir>/examples -DCMAKE_MODULE_PATH=<absolute_path_to_fsdk_root_dir>/examples/cmake ../example_bestshot
$ cmake --build . --config Release --target install
```

Running on linux

There is prebuilt demo, see FSDK_ROOT/examples/bin/*possible_output_prefix*/ . To run it change your working directory to FSDK_ROOT and type:

```
$ ./examples/bin/*possible_output_prefix*/PhotoMakerDemo
```

Running on windows

For windows you will have to run bat script that is in the same directory as PhotoMakerDemo.exe. It's win32_copy_script.bat for win32 and win64_copy_script.bat for win64. So for windows, to run demo you will have to type:

```
$ .\examples\bin\*possible_output_prefix*\win32_copy_script.bat  
$ .\examples\bin\*possible_output_prefix*\PhotoMakerDemo.exe
```

or:

```
$ .\examples\bin\*possible_output_prefix*\win64_copy_script.bat  
$ .\examples\bin\*possible_output_prefix*\PhotoMakerDemo.exe
```
